UNIT 3 EXIT TICKET · LT 3.1, 3.2 · ADVANCED

Lesson 1 · Sunlight to Sugar to ATP

Name _____ Period ____ Date _____

1. Complete the first link of the loop.
   sunlight → _____ in the _____ → sugar

2. When ATP loses a phosphate it becomes _____ and releases energy. Explain why a muscle cell never runs out of ATP during a long run.

3. Use the word **chlorophyll** in a sentence that tells what it does.

On the back: How does sunlight power your leg muscles? Your first answer. Keep it.

Lesson 1 · Sunlight to Sugar to ATP

Name _____ Period ____ Date _____

1. Circle the process.
   sunlight → (photosynthesis / cellular respiration) → sugar
2. When ATP loses a phosphate it becomes:
   (ADP / DNA / glucose) That (releases / stores) energy.
3. **Chlorophyll** is:
   (a) a green pigment that captures light (b) a sugar (c) the organelle that makes ATP

On the back: How does sunlight power your leg muscles? Your first answer. Keep it.

Lesson 2 · With Oxygen or Without

Name _____ Period ____ Date _____

1. Complete the second link of the loop.
glucose + oxygen → _____ + _____
+ ATP, in the _____

2. Circle every one that carries out cellular respiration: oak tree · yeast · bacteria · human · mushroom. Which one do people most often leave out, and why does it belong?

3. A hiker's leg muscles run short of oxygen on a steep climb. What happens in those muscle cells?

(a) Glucose still breaks in the cytoplasm for 2 ATP, and lactic acid builds up

(b) The mitochondria keep making about 36 ATP per glucose

(c) The cells switch to making ethanol and carbon dioxide

(d) The cells stop using glucose

Advanced: in one line, why does the hiker get tired faster?

Canvas Original #38 · © J. R. Schwebach, CC BY-NC 4.0 · scienceonepagers.org
